

We are launching an immersion program for exceptional college graduates or dropouts who'd like to help xAI train and efficiently run the world's best models. During your first 6 months, you'll work with a variety of modeling teams across the Main model, code, image/video, voice, and computer use.

The assignments will be rotational, and you'll get exposure to numerous teams during your first 6 months. Within that time, you'll be matched with a long-term team based on mutual fit and interests.

Once assigned to a team, you'll focus on crafting evals and RL environments that are incredibly thoughtful and built around high-value use cases. Based on the learnings from the evals, you'll be expected to be part of debugging and improving the models to close the loop on usefulness.

Example Use Case/Approach

- Use case to evaluate: Is our model useful for game development/gamers?
- Research: Use AI tools and the X/xAI network to connect with high-taste game developers and deeply understand how they'd like to use Grok for their workflows.
- Hands-On Testing: Start working with the model yourself to try to achieve these use cases, documenting all the problems and friction points along the way.
- Scale the Testing: Turn these game development tasks into thoughtful evals and RL environments for large-scale model evaluation.
- Root Cause: Once you identify areas in which our model is not able to reach desired outcomes in game development, identify the root causes and improvement areas.
- Improvement: Work closely with our data and training teams to create improved versions of the model tailored for game studios and indie creators.
- User Validation: Share the improved model with high-taste game developers to confirm the model actually improved on their targeted use cases.

Next Steps & Prep Exercise

- Put together 3 areas of usefulness you'd like to potentially focus on. Have them in priority order. Your level of details for each area of usefulness could vary depending on its priority level.
- An "area of usefulness" should be intuitive, representing a user group that could create high economic value. If the top-level group is large please break it down. Example: Software Engineers (too high). Sub-group: "Game Developers"
- For each area of usefulness you think have the following"
 - 1) Why are you interested in this area?
 - 2) How good do you think grok is in this area and why?
 - 3) Share a Grok conversation you have to assess what could be good evals for this specific area and how to approach building evals for this area
 - 4) 3 specific X profiles of people that could represent power users and be great to guide you on shaping evals/giving feedback
